61-1

[redacted]

Purpose: To study the role of the human brain in overall adaptive behavior. Specifically, to show the relationship of changes in behavior due to stress (mental disorders, sensory deprivation, peptic ulcers, threatening life situations, etc.) to changes in behavior brought about by actual loss of cerebral tissue (MKULTRA 61).

Initiated: Original research program initiated in 1956 as part of [redacted] project. Current research initiated in August 1960.

Contractor: Dr. [redacted] as a grantee of the [redacted]

Cost: $60,797.36. (This is the last year in which this activity will be funded by the Agency.)

Status:

Gentlemen:

We are pleased to be able to transmit to you the following funds:

Treasurer's Check No. 177038 drawn on t[redacted] F
[redacted] or $58,459.00
dated September 16, 1960

Treasurer's Check No. 255091 drawn on [redacted] F
[redacted] or
$2,338.36, dated September 16, 1960.

These funds represent a contribution for the use of your directors in carrying out the very worthwhile research goals of your organization.

Yours truly,

Encl.

DRAFT A

29 August 1960

MEMORANDUM FOR THE RECORD

SUBJECT: Continuation of Project MKULTRA, Subproject 61

1. The purpose of this Subproject is for support for one year of Dr. [redacted] studies on the role of the human brain in overall adaptive behavior. It has been shown that changes in behavior due to various kinds of stress (sensory deprivation, threatening life situations, mental disorders, peptic ulcers, etc.) are comparable to those behavioral changes which are brought about by actual loss of cerebral tissue. In the course of this research new techniques of measurement and new instrumentation is being developed with applications in other areas of TSD interests.

2. It is anticipated that this will be the last year in which this research activity will be funded by us. Although several portions of the work have been and will continue to be supported from other sources, it is felt that Dr. [redacted] and his group can obtain total research support for continuing work in this area from other Government and private sources after this next year.

3. [redacted] shall function as cover and cutout for this project. The attached proposal indicates a cost of $58,459 for one year. To this must be added $2,338.36 which represents the 4% service charge due to the cutout. The cost of the project for one year will therefore not exceet $60,797.36. Charges should be made against allotment #1525-1009-1902.

[redacted] 137475

617

[redacted] Authority of: 187475

CL BY 187475

61-7

Proposed Activities from September 1, 1960 through August 31, 1961 of the

[redacted]dy Group, [redacted] under the direction of [redacted]

The group will continue to investigate the role of the central nervous system in human disease.

1. One branch of these activities will be concerned with extending and analyzing a phenomenon established in previous studies, that the functional capacity of the central nervous system is impaired following prolonged periods of inadequate and unsuccessful adaptation. Two projects will be carried out. The first is an extensive analysis and comprehensive formulation of data already gathered in which the highest integrative function of patients diagnosed as having chronic [redacted], and of patients with prolonged and severe [redacted] were assessed. As the analysis proceeds additional psychological tests and observations of such subjects will be required. The second is concerned with the observation that subjects with [redacted] as well as ostensibly intact patients with prolonged and [redacted] are defective in their capacity to form "temporary cerebral connections" or "conditioned reactions" as demonstrated by the electroencephalograph. These observations will be extended to include hospitalized patients with schizophrenic reactions, patients with lesions of the brain in regions other than the cerebral hemispheres, and subjects who are experiencing severe stress and/or anxiety, especially in subjects who are adapting to a new environment.

2. Studies designed to examine the hypothesis that the mediator substance of axon reflex vasodilatation (neurokinin) is implicated in the mechanism of a variety of disease states.

[redacted]

a) It has been established that neurokinin is present in increased amounts in the painful and tender regions of the scalp during vascular headache of the migraine type. Further characterization of the pharmacodynamic and biochemical features of this subcutaneous perfusate will be carried out. Also, a laboratory method will be sought for screening of agents possibly useful in treatment of migraine headache. This method would be based on the properties of agents that antagonize neurokinin or the neurokinin forming enzyme.

b) Attempts will be made to measure the neurokinin content of perfusates and "washes" of abdominal viscera before and during interviews dealing with aspects of the patients' life situation that are particularly threatening. Patients with colostomies or ileostomies with and without ulcerative colitis will be one group studied. Subcutaneous perfusate of urticarious regions of skin will also be studied.

3. Biochemical and pharmacological studies of neurokinin will continue.

a) Methods are now being developed to prepare large quantities of neurokinin.

b) In cooperation with the Department of [redacted] purification and chemical characterization of neurokinin will be attempted.

c) Pharmacological studies of the properties of neurokinin will be continued. Preliminary studies have indicated that neurokinin is antagonized in vitro by the steroid hormones of the adrenal cortex and by salicylate. This observation may be pertinent to the anti-inflammatory action of these agents. Studies of the action of these agents on the enzyme that forms neurokinin will be undertaken. Also it has been observed that LSD-25, an agent that induces delirium when administered in extremely small amounts, strongly potentiates one apparent action of neurokinin (stimulation of respiration). Related substances

[redacted]

BOL, UML, do this to a lesser degree. These observations are particularly interesting in view of our observation of the abnormally high levels of neurokinin-forming enzyme in cerebrospinal fluid collected from patients wi[redacted] Also, preliminary observations of the behavior of unanesthetized cats receiving intraventicular injections of neurokinin suggest that a catatonic state is induced. These observations will be extended in an attempt to gain additional background information to guide studies with human subjects concerning the role of neurokinin in the impairment of the highest integrative functions of the brain observed in those with psychosis. Thus a number of agents will be examined in the search for antagonists and potentiators of neurokinin.

4. a) A book length monograph, tentatively entitled [redacted] summarizing and reporting the previous activities of this group will be prepared.

b) A revision of the book[redacted] under way by Dr. [redacted]

25 June 1959

MEMORANDUM FOR: THE RECORD

SUBJECT : Continuation of Project MKULTRA, Subproject 61

1. The purpose of this subproject is the continued support of Dr [redacted] studies on brain damage in human beings. Work in this field has made good progress during the past year. Highlights relating to this are quantitative clinical demonstrations of a much more precise nature than was ever before possible of the actual performance deficit brought about by suppression of the activity of various areas of the central nervous system. New methods of measurement of circulation changes involving the use of implanted thermistors of a very sensitive type have served to reduce the uncertainty of many of the experiments in this field of research.

2. During the coming year it is anticipated that many of the investigative techniques worked out in the past will begin to show their effects in terms of a vastly increased rate of significant data production.

3. This project has been reviewed and approved by the Board of Directors of the [redacted] It should be noted that Dr [redacted] receives no stipend under the attached budget and that several portions of the work to be covered will be supported by other than government sources.

4. The cost of the program for a period of one yeart starting 1 July 1959 is estimated to be $58,459.00 [redacted] will be used as a cutout for transferring the money [redacted] of the funds required for one year $20,198.20 is being obligated at this time. Charges should be made against Allotment 9-2502-75-902. Remainder of funds required will be obligated when FY60 funds become available.

B

[redacted] STUDY PROGRAM, [redacted]

Study of Highest Integrative Functions: Progress Report, and Proposal for the Coming Year.

I. Present Status of the Study:

The investigations of the highest integrative functions are fundamentally aimed at increasing our understanding of the functions of the human cerebral hemispheres in overall adaptive behavior.\ They arose out of our laboratory and clinical experience during the past twenty years, and especially out of our interest in the phenomena exhibited by men exposed to extremely threatening life situations; and they were initiated during the period when we were investigating the untoward effects of Communist police procedures.

The body of evidence accumulated during these studies indicated that under extremely adverse circumstances men may develop symptoms clinically difficult to distinguish from those produced by gross brain damage or by agents that impair cerebral metabolism: lack of discrimination, poor tolerance of frustration, heightened suggestibility, illogical thinking, breakdown of defense mechanisms, mental clouding, disorientation, and frank delirium. The initial efforts to elucidate these phenomena began several years ago, and have largely been brought to a conclusion during the past twelve months.

The first step in this study was the systematic investigation of the highest integrative functions of people who had suffered damage to their cerebral hemispheres, the amount and location of which was known as precisely as possible. During the course of four years, 250 such people were studied. In order to provide them with the widest possible opportunity to expose their defects in function, many areas of their adaptive activity were explored, both outside and within the laboratory. Subjects were observed in their performance on clinical assay procedures, including some that are well known as well as others that were newly devised. They were exposed also to procedures

[redacted]

especially designed to investigate areas of behavior such as perseveration, which were of special interest. In addition to this, each was studied extensively by the usual clinical, neurological, and psychiatric methods. Finally, an extensive review was made of his life history, both before and after his brain injury, with special attention to his performance in the more complex areas of his life adjustment, such as his capacity to deal with the requirements and challenges arising in his family and in his work.

The second step in the investigation was a similar study of ostensibly intact people with no known gross damage to their cerebral hemispheres. Two groups of such people have been investigated: 50 people with disorders such as chronic anxiety, tension, depression, and schizophrenia, and 25 people with bodily illnesses such as peptic ulcer, ulcerative colitis, or migraine headaches.

II. Findings to date:

From the integration of all of the data obtained from people with damage to the cerebral hemispheres, it has been possible to define some of the adaptive functions of the human that are primarily subserved by the neopallium. These have been called the "highest integrative functions" of the organism, and they have been placed in four general categories, viz:

(a) The intact neopallium enables a man to express his appetites, drives, and feelings in a manner appropriate to life in a complex society.

(b) It provides him with mechanisms for the achievement of complex goals (learning, memory, logic, etc.).

(c) It enables him to maintain a high degree of tolerance for frustration and failure when confronted by conflicting drives, and to recover promptly from the effects of frustration and failure when they occur.

(d) It provides him with the capacity to maintain effective and well-

modulated defense reactions (i.e., repression, denying, pretending, rationalization, blaming, withdrawal, phantasy, depersonalization, obsessive-compulsive behavior, and bodily reaction patterns involving alimentation, respiration, metabolism, etc.).

Evidence from the study of the brain-damaged indicates that these highest integrative functions are not localized within the hemispheres. They fall off in a graded fashion dependent upon the amount of hemisphere tissue that is lost, and without regard to its location. Moreover, they fall off long before less highly organized functions, such as simple memory, the ability to calculate, or the ability to carry out tasks of some complexity learned prior to the brain injury, are lost.

Evidence from the study of the chronically anxious, tense, depressed, and schizophrenic subjects indicates that their highest integrative functions, as judged by their performance on the tests and in their life adjustment, falls off in a manner not distinguishable from that of people who have sustained brain damage. They can, of course, be distinguished from people with gross brain-damage by the absence of localizing neurological signs, and by the intactness of some of their less complex functions; but in their inability to express their feelings appropriately, to utilize their goal-achieving mechanisms effectively, to tolerate frustration and failure, and to maintain well-modulated defense reactions, they are indistinguishable from those who have sustained direct damage to their brains. In many instances their functions are impaired to a degree equivalent to that produced by a large loss of hemisphere tissue (100 grams).

Similar degrees of impairment of the highest integrative functions have been found in people with disturbances of bodily adaptive reaction patterns such as peptic ulcer, which are intimately tied up with the general life adjustment.

These two groups of chronically ill people, in short, show manifestations of an impairment of their cerebral hemispheres. Because some of the disturbances of these people are transient, the impairment of their hemispheres is to some extent reversible and is said to be "functional"; but since many of their illnesses, like schizophrenia, ulcerative colitis, and chronic psychoneuroses, and their accompanying failures of life adjustment, are notoriously unremitting, it seems quite likely that some of these people have, in effect, a severe and permanent impairment of their neopallium.

This evidence of severe, and possibly permanent, impairment of the function of the cerebral hemispheres raised the question of whether other, and chemically detectable, evidences of altered brain metabolism might be found in people in whom, up to the present, only symptoms of disturbed function had been described. It seemed possible that substances associated with disturbed cerebral metabolism might appear in the spinal fluid, and might be found there in people with disturbances of cerebral function.

Therefore, the initial search was directed toward the detection, in the spinal fluid, of substances that might be related to disturbed brain metabolism.

This investigation has been unexpectedly fruitful. By exposing to beef globulin spinal fluid taken from people with known damage to the cerebrum, it has been shown that these spinal fluids contain a substance with the characteristics of an enzyme, which breaks down the globulin to a polypeptide. This polypeptide has not been identified chemically, but in biological preparations it has many of the characteristics of a polypeptide found in blister fluid and other inflammatory exudates, which has been called "bradykinin".

This enzyme has been found to be present in the spinal fluids of 45 out of 50 people with various forms of active brain damage. It has been found also in the spinal fluids of 13 out of 15 people during attacks of vascular headache. It has not been found in the spinal fluids of 50 persons who

61-41

had no evidence of disease of the central nervous system. It was found in the fluid of some persons who were experiencing much stress.

Of perhaps greatest interest, it has been found in the spinal fluids of 45 out of 50 people with active schizophrenia, but without other evidence of disease.

We believe that the finding of this enzyme-like substance and polypeptides under the circumstances described supports other evidence that metabolic disturbances occur in the brains of people with headache and schizophrenia. We expect that the same substance will be found in the spinal fluids of people with other chronic disturbances of their highest integrative functions.

It is well known that profound disturbances of the highest integrative functions, accompanied by pronounced disturbances of mood, thought, and behavior, may be produced in people by exposing them to environments to which they can make no adequate adaptation, such as concentration camps, or prison procedures aimed at interrogation and indoctrination. Therefore, it seems reasonable to infer that exposure to such a situation in itself produces an impairment of cerebral hemisphere function; and that this impairment may sometimes be very grave.

III. Proposal for the Coming Year:

1. A monograph titled [redacted] is planned for completion during 1958. The major goal of this publication will be to define the defects in highest level adaptive capacity that occur with disease of the neopallium, and to illustrate how these defects are similar to those produced by prolonged existence in an unadapted state. It is intended that the description of the components of the highest integrative functions will be comprehensive enough to take into account the various elements of diseases

[redacted]

characterized by prolonged disturbances of mood, thought, and behavior.

This project will be undertaken primarily by Dr. [redacted] with an editorial assistant.

2. In order to assess further the highest integrative functions of a people with chronic illness not ostensibly involving the central nervous system, a study of a carefully chosen group of young people with diabetes mellitus will be undertaken. Data with regard to their health, personalities, and interaction with their social environment will be gathered by members of the staff under the direction of Dr. [redacted] using methods similar to those used in the [redacted] study. Support for this investigative effort in general is being sought from other sources; but for the special psychological testing needed for this aspect of it a full-time psychological technician and a psychologist will be required.

3. The follow-up study on the [redacted] will likewise provide an opportunity for the study of their highest integrative functions, and an estimate of the influence of their life experiences upon this. The methods will be those that have been described; most of the necessary data are already available, and only a moderate amount of additional testing need be done.

4. A similar study, using a carefully selected group of working women, largely homogeneous in its composition, will be carried out. Records of health, attendance, and performance on the job, covering periods of more than twenty years, are available for these women. Those to be tested will be selected to include some with records of outstandingly good health and performance, some with outstandingly poor health and performance, and some whose performance was near the median in these respects. A large part of the cost of this project also will be borne by other sources.

5. In order to make a further assessment of the effect of damage to the neopallium upon general health, a group of thirty subjects with focal removals

[redacted]

61-411

of major and minor portions of the cerebral hemispheres will be examined to ascertain the illness episode rate of these people before and after the damage was sustained. Interest will also be centered on the manner in which this damage to the cerebrum altered the individual's perceptions of the threats and challenges presented to him by his environment.

6. The studies of the proteolytic enzymes in spinal fluid will be continued, with three immediate goals:

a. The development of a simple, readily repeatable method for the quantitative estimation of the proteolytic activity of spinal fluid. The present bio-assay technique is cumbersome and technically demanding. A simple chemical test may be possible. If such a method can be developed, a large series of measurements of proteolytic activity in spinal fluid will be undertaken, using specimens obtained from the neurological services of the [redacted] Hospital, [redacted] Hospital, and possibly the [redacted] Hospital. B

b. The appraisal of the significance of the observation that increased amounts of proteolytic activity are present in spinal fluid at some times, and in some people. One approach to this problem will be through ascertaining the effect of a sterile, injectable "anti-bradykinin" agent, in the form of chymotrypsin. The effects of intravenous, intramuscular, and perhaps intrathecal injections of this and similar substances, after suitable precautions have been taken to ascertain the safety of such procedures, will be undertaken in people with migraine headache and schizophrenia.

c. Pharmacological studies will be undertaken in order to establish whether or not the proteolytic enzyme observed is identical with a known bradykinin liberating enzyme.

7. Attempts to develop new methods for the study of the highest integrative functions will continue; one method now being considered is that of conditioning

64-41

the electroencephalographic response in brain-damaged persons.

8. Investigations of the local cerebral circulation will likewise be continued.

[redacted]

MEMORANDUM FOR: THE RECORD

SUBJECT : Continuation of Project MKULTRA, Subproject 61

1. The purpose of this subproject is the continued support of Dr [redacted] studies on brain damage in human beings. The attached proposal outlines progress in this field to date and indicates the plans for new work to be done during the coming year. In general, the current and future emphasis of the program will involve studies of metabolic and biochemical changes associated with impaired brain function related to other types of brain damage than actual tissue loss.

2. This project was reviewed and approved by the Board of Directors of [redacted] at the meeting of 11 March 1957. It will be noted that the attached budget indicates an expenditure of $61,805.00. Dr [redacted] has agreed to obtain $11,805.00 of this from other than Agency sources, lowering our contribution thereby to $50,000.00.

3. The cost of the program for a period of one year starting 1 July 1957 is estimated to be $50,000.00 [redacted] will be used as a cutout for transferring the money to [redacted] charges should be made against allotment 8-2902-10-001.

4. [redacted] has requested [redacted] to submit to them a summary accounting on an annual basis of all monies received from [redacted] Also, it has been requested that any unexpended funds be returned as soon as possible upon the close of the grant year.

5. Title to any permanent equipment purchased by funds granted the University shall be retained by the University in lieu of higher overhead rates.

6. In connection with travel under this project, it is agreed that the Agency will accept the travel documentation and accounting which conform with the practices of the University.

[redacted] Project - Plans for the Coming Year, July 1957 - June 1958

The investigations in Brain Function initiated in the [redacted] Program were based on the postulate that the functions of the human brain and possibly its structure may be damaged as a consequence of prolonged stress. This thesis is now almost fully documented. Early in the study, impairment of the highest integrative functions was defined through the elaboration of methods for the study of highly selected subjects with loss of known amounts of tissue from the cerebral hemispheres. These persons were studied by a large aggregate of quantitative behavioral indicators and by means of extensive information from their families and their associates. It was then demonstrated that the highest integrative functions are impaired to a degree closely linked to the mass of tissue loss, regardless of site, and in a manner determined by the subject's development, previous life experience and prevailing high level adaptive reactions.

These methods were next applied to several groups of persons who had suffered prolonged stress. The evidence gathered indicates that the brain is vulnerable when severe threat is prolonged, and may be damaged when there is a failure in high level adaptation for long periods. Those persons who perceived themselves as most threatened, and who exhibited the most serious abreactions, were those who were most severely impaired in their highest integrative functions. Such defects were sometimes major and in some instances incompletely reversible. To explain such defects, a thesis currently entertained by the laboratory is that the observed dysfunction may be related to neurohumoral and biochemical aspects of inappropriate and faulty metabolism that are capable of investigation.

The program for the current year will include extensive further documentation of the above thesis with explorations of the biologic mechanisms behind these damaging processes. It is hoped that, by so doing, ways and means of avoiding and eliminating the above described abreactions will be forthcoming.

[redacted]

The personnel and equipment will remain the same. The funds involved are detailed on the attached sheet.

Budget for the [redacted] Study Program, Fiscal Year 1957-58

Dr. [redacted] Project

Dr. [redacted]	project director	9,000	
Dr. [redacted]	neurologist, part time	5,000	
Dr. [redacted]	biopsychologist, full time	9,000	
Dr. [redacted]	neurologist, part time	4,000	
Dr. [redacted]	psychologist, ½ salary	4,750	
Mis[redacted]	research asst.	6,000	
Miss [redacted]	secretary	3,300	
Miss [redacted]	technician	3,400	
Miss [redacted]	typist	2,950	
		47,400	
	5% Retire. and 2¼% Soc. Sec.	3,437	
			50,837
Special Payments			200
General Supplies			500
Technical Equipment			1,000
Technical Supplies			300
Miscellaneous			100
Travel			750
Reference Library			100
Statistical Services			2,400
			56,187
	Admin. Fee 10%		5,618
			$61,805

[redacted]

61-45

SUMMARY OF EXPENSES ON [redacted] ACCOUNT FOR FISCAL YEAR 1956-57 [redacted]

Amounts Obligated in FY 1955-56 but Paid in FY 1956-52		
Equipment	399.55	
Supplies	352.76	
Reference Library	23.29	
Miscellaneous	120.09	
Telephone, electricity & exterminator	190.79	
Travel (including taxis)	316.42	
		$1,402.90
Dr. [redacted] Project		
Equipment	2,114.49	
Supplies	2,534.46	
Reference Library	129.15	
Miscellaneous (including warehouse bill, settlement with Mrs. [redacted] malpractice insurance, install. of air conditioners, and reprints AMA Neur. & Psych.)	2,040.28	
Salaries (includ. Soc. Sec. and 5% Retire. Plan)	37,803.68	
Special payments	4,634.74	
Utilities	869.80	
Travel	1,337.98	
Administrative Fee	2,598.85	
		54,063.43
Dr. [redacted] Project		
Supplies	520.55	
Reference Library	24.86	
Miscellaneous	57.99	
Salaries (includ. Soc. Sec. and 5% Retire. Plan)	45,120.02	
Special payments	285.41	
Travel	435.18	
Administrative Fee	2,041.95	
		48,485.96
[redacted] Project		
Supplies	3.75	
Rooms (for interpreter & informants)	350.00	
Meals, Taxis & Misc. for informants	1,165.00	
Informant Fees	1,400.00	
Reference Library	11.85	
Salaries (includ. Soc. Sec. and 5% Retire.)	11,630.65	
Special payments	5,400.98	
Travel	21.22	
		19,983.45
Rent for [redacted]		6,675.00
		130,610.74
Obligated for Administrative Fee		6,300.00
Total unpaid bills (including security on [redacted]		2,051.00
	Total	$138,961.74

MEMORANDUM FOR: CHIEF, FINANCE DIVISION

VIA: TSS/Budget Officer [redacted]

SUBJECT: MKULTRA Subproject 61
Invoice No. 2, Allotment 6-2502-10-001

1. Invoice No. 2 for the above subproject is attached. Payment should be made as follows:

Cashier's check in the amount of $6,512.50, drawn on a [redacted] Bank,
Cashier's check in the amount of $6,512.50, drawn on a [redacted] Bank,
Cashier's check in the amount of $16,050.00, drawn on a [redacted] Bank,
Cashier's check in the amount of $10,000.00, drawn on a [redacted] Bank.

All four checks should be made payable [redacted]

2. Please forward the checks to Chief, TSS/Chemical Division through TSS/Budget Officer by Friday, 18 January 1957.

3. This is a final invoice. A total of $58,612.00 was obligated under this subproject during FY 56. However since it is anticipated that additional funds will be obligated for this project, the files should not be closed.

MEMORANDUM FOR: THE RECORD

SUBJECT : MKULTRA, Subproject 61

C

1. Subproject 61 is being initiated to support the brain studies of Dr. [redacted] located at the [redacted] B

C

2. The scope of Dr [redacted] rogram will encompass the following phases (see attached proposal for detailed discussion):

(a) To systematically collect and evaluate current research on central nervous system function and structure in order to understand better what types of research on modification and exploitation of CNS function will be most productive.

(b) To assess the elements of frustration adaptation by studying the reactions of brain damaged and non-brain damaged individuals to artificially induced frustration designed as a prototype of certain situations commonly encountered in nature.

(c) To evaluate these reactions to see to what extent frustration adaptation can be prevented, postponed, modified and predicted.
