BJECT: Bluebird Activity. Technical Aspects

Supplementing a report dated 23 February 1951, following is a summary of me technical problems which confronted the B. Team in the field.

Technical Equipment Available. The team was assured that sufficient technical ulpment of good quality existed in the field and would be immediately placed at r disposal upon arrival. This equipment consisted of one wire recorder and the n of one polygraph instrument. Repairs were effected on the recorder before could be used. The quality of this recorder was not considered good enough to cord interrogations with the idea in mind that such recordings would be used r future transcription or training purposes. A request was made for equipment, ssibly renting locally. A search was made in the local market and no such ipment to fit our needs could be found. An employee succeeded in getting one me Model American Tape Recorder. This machine was immediately put to use.

The polygraph instrument was used only as a cover. However this was rtunate, since the Electrodermal Unit was inoperative in each session. Repairs re not attempted since it was indicated th facilities for repairs existed locally.

Results. Recordings were made of all pertinent questioning and were of erage quality. A complete transcription has since been made. The need for rtable photographic equipment was urgent. Nothing in this type of equipment uld be located when needed.

Recommendations. Prior to future trips, the B. Team should be completely formed of existing equipment in field stations prior to their departure. However in this connection preparations are now being made to have in readiness mplete units of technical equipment for immediate use. Consequently should re be a shortage of desirable equipment, it could be immediately be dis- tched to the field installation.
