(1) Y' notes —

(2) [redacted] H-B/6

A - General Background
B - Recent Situation
C - Specific H Background
D - Security

E. Proposed Course

Have [redacted] re contact him - give him
motivational review - list items for guided research

F. Specific Instructions

B/6 (2) Start immediately full investigation [redacted] with
all resources of assistance, cooperation, and

(1) Bring to bear for

A An interview with [redacted]

A: [redacted]

B Full, detailed study by [redacted]
on material furnished by [redacted]

A [redacted]

C Interview again with [redacted]

A [redacted] re contact,
re salary, location, restricted etc
P.H.S. etc

(3) After fully digested and details filed on —
give [redacted] specific instructions for
practical research (see following)

B/6

(4) Train mind to [illegible]

5 Electrical problems

1 Diffusion

2 Geriatrics

3 Specific targets

hijack

self de

fast field operations

drug usage

long range

transfer of control

special devices

guns

6 Evaluation

A

1 of 3

A1B, 4, 22/6

Proposed subject of study - [redacted] on OSI H-B/3 research.

Basis — How can sodium A or B or any other steps in dancing agent be first concealed in a universal or common preparation?

Premise — Thirst can be induced by keeping subject from water or giving them salty foods
- Coffee, brandy, liquor, tea are common requests if a person is chilled or cold.
- Cigarettes, cigars are almost universally used

Items suggested for tests using any known sodium salts inducing agents. The effect should be about that of 6 cc of sodium amytal on average adult taken orally. Originally the more rapid the induction of steps the better for operational purposes but a delayed action (if time could be standardized) might also be of value.

1 Water
2 Liquors (include whiskey, brandy, vodka, schnapps, gin, etc.)
3 Wine
4 Beer
5 Coffee
6 Tea
7 Cola Cola
8 Milk - Cocoa (possibly cheese)
9 Ice cream

10 - Candy (all kinds - domestic, foreign)
11 Gum
12 Aspirin tablets
13 Common medicines {APC tablets, cough syrup, gargle, milk of magnesia etc
14 Tooth paste
15 Foods - in general

* - In connection with the above a parallel study should be made of methods, techniques, (drugs, chemicals etc) that could be used to combat and counteract these effects in dealing agents ~~that~~

A - In advance
B - At the same time
C - Over long periods of time
(probably by building up additional resistance)

A [redacted]

Letter to [redacted] A|B, 4, 22|5

H-B|6

B|3

Reference is made to our recent conversations concerning matters of special interest to yourself and this agency.

I am transmitting herewith two (2) memorandums which are self explanatory.

It would be appreciated if you would forward these memorandums to the special project for their consideration and action.

Will you kindly arrange that any material or information made available by the special project be forwarded to me at my office at your earliest possible convenience.

As previously discussed, the interest of this agency in these matters should not be disclosed.

Very truly yours

[redacted]

## III. POTENTIALITIES OF USE OF S.I.

While H and S.I. techniques have been known and used for a great many years, there is very little accurate information available on the specific application of these techniques to information obtaining and, including, use and propaganda uses. Furthermore, other than cursory use of these methods, there is no accurate information on the techniques and methods used by the USSR and the satellite countries in such matters as the 037-31 "Surgical Tables", the [redacted] and [redacted] tricks etc. In addition, there are few extensive works or research available in this country specifically on the use of chemicals, drugs or gases in connection with human behavior and more particularly as a base for SI experimentation. Hence, it appears obvious that research, testing and experiment along these lines must be done more or less from scratch. However, Stanford Research Institute believes that the chances of success in very advanced SI experimentation attempts (See following) are good and this opinion is shared by certain individuals having expert knowledge of these techniques.

H-B/6

In view of the above, it is obvious that this agency should carry out extensive research and considerable practical work. To date Stanford will have to search and catalog

I ~~CIA~~ has engaged in certain limited research and study, some experimentation and two operational projects. Results have been unconvincing, but all individuals involved ~~[illegible]~~ agree with the fact that considerable research, experimentation and above all basic, simple, individual practice is completely essential in the development and (?)training of Bluebird team members. Toward this end Bluebird I ~~CIA~~ has set out its basic plans and its ideas for the implementation thereof above. However, while the various ultimate goals are in the use of LSD and SI techniques and what is learned from research, have not as yet been set out in this report. These aims are stated ~~below~~ immediately following in detail:

I Research

A. ~~Chemistry~~ Chemistry — It is hoped that the entire field of ~~drugs~~ chemistry will be explored in an effort to develop new or further developed previously tried sleep inducing agents, paralysis producing agents and agents that break down human will and inhibitions or in any way affect human behavior patterns. (This research should include narcotic drugs, chemicals, gases, glandular secretions, etc.) Research should also be carried on to develop combining agents, conditioning agents for use of the above

c-2

B. SONICS, ULTRASONICS — There is very little accurate information in this field. It is hoped that research will be carried out to test the effects of ultrasonics on human behavior. Countering measures must also be developed.

C. Methods of injection, delivery — Intra Blackbird has already begun reporting information of all types on the use of hypnosis (or related techniques). Some work has been done in connection with various gas guns but a great deal of research is necessary. Also very close liaison should be established with the [redacted] H-B/3 The whole field of guns — particularly odorless, quick acting guns should be explored. (Details on the German SCHEINTOT (WWII) pistols "appearance of death" should be obtained)

D. Sleep inducing machines — The field of mechanical aids to induce sleep or assist in sleep techniques needs full exploration. The electronic "sleep inducing machine", the electroencephalograph, the various "shock" devices may prove to be adaptable for use in experimental work under certain circumstances.

d

E. Concealment of drugs in common objects — 1755 Bluebird has previously prepared a request for a study of methods whereby drugs can be effectively concealed in common objects such as water, beer cans, candy, cigarettes, gum etc etc. Items so impregnated may, in the near future, be of extreme value in field operations.

F. Detection of drugged individuals or individuals previously conditioned by SI. A clinical study should be made to ascertain methods whereby agents of this agency could rapidly and conclusively under field conditions, determine whether any subject was drugged or conditioned by many SI operations.

G. Collection of intelligence — 1755 Bluebird is supposed to receive regularly from agency sources all information bearing on H, SI and interrogation methods throughout the world. This information has not, in the opinion of 1755 Bluebird, been forthcoming although from time to time we have received some interrogation re SI material. It is hoped that research under the proposed plans will be more active and more productive than heretofore.

## PRACTICAL EXPERIMENTATION

1955 Bluebird recognizes that between clinical experimentation and practical field operation there is a world of difference. In the above set out projects under "IMPLEMENTATION", 1955 Bluebird has in general terms explained its plans for training Bluebird candidates in the practical or field application of H and SI techniques. Briefly it is proposed to train Bluebird candidates in H and SI work in the US before sending them to overseas establishments. This method would ensure the overseas Base that Bluebird teams and their crews thoroughly understand H & SI work and would have had considerable practical field work before they began operations overseas.

As stated many times previously and not out above under BASIC PLAN there are four (4) basic problems to be resolved. These are:

1 — 2 — 3 — 4 —

Bluebird believes that 1 (above) can now be answered in the affirmative using H and SI techniques. Bluebird is not fully satisfied with results to date, but believes with continued work and study reasonable and profitable results can be obtained regularly.

However 2, 3 and 4 (above) are

F

as yet unanswerable although Bluebird is of the opinion that there is a very worthwhile chance that all three may at some future date be answered affirmatively. This opinion is supported by a number of individuals having knowledge of these techniques and by certain literature and intelligence in this field. It is obvious that if ~~these questions~~ questions 2, 3, 4 can be affirmatively answered the results would be of incalculable value in future operation of this agency.

P set out below are a series of questions which represent, if answered affirmatively, ultimate goals in ~~it~~ and ~~it~~ techniques. These questions can only be answered by actual tests. ~~It~~ Bluebird will conduct these tests for training and research purposes under controlled conditions in the U.S. The known and useable results will thereafter be applied to overseas materials first for testing and then operationally.

Note — These questions have been set out in general in other reports from Bluebird to the Deputy Security but are restated again for matter of record.

G

1. Can we "condition" by post-H suggestion or by any SI technique agency employees (or persons of interest to the agency) to prevent them from giving classified information to any unauthorized source or from committing any act on behalf of a foreign or domestic enemy?

2. Can we by H or SI techniques force a subject (unwilling or otherwise) to commit an action contrary to an individual's basic moral principals?

3. Can we by H or SI techniques force a subject (unwilling or otherwise) to perform an act for our benefit irrespective of the subjects previous loyalty, training or background?

4. Can we by H or SI techniques force a subject (unwilling or otherwise) to travel long distances, commit specified acts and return to us or bring to us documents or materials? Can a subject acting under H or SI control successfully travel long distances, pass thru customs, make transfers etc? How far can a subject thus travel? Does such travel require a "reinforcement" of the control en route?

10

5. Can we devise a position for making unwilling subjects into willing agents and then transfer the necessary control of the subject to untrained agency procured in the field by the use of code, identifying signs, symbols, credentials, words etc?

6. What would be the fastest way to induce H and SI conditions (A) in a willing subject (B) in an unwilling subject (C) with drugs, (D) without drugs (E) mechanically (F) electronically?

7. Could we seize a subject and in the space of an hour or two by post H or SI control have him crash an airplane, wreck a train, set off an explosive charge etc?

8. Can we devise a standard sample relatively fast technique for inducing H and SI conditions that can be used by untrained agency personnel in the field (with or without drugs, mechanical aids etc)?

9. Can we, using ST 4 and 51 techniques extract complicated formulae from scientists, engineers etc if unwilling? Can we extract accurate details of, given instruments, emplacements, conducting fields, factories, mines etc from subjects having such special information?

10. Can we, while a subject is under ST 4 and 51 control, show them a map or chart and have them point out specific items, directions, routes, buildings etc. Can we also have them make detailed drawings, sketches, plans (technical or otherwise)?

11. Can we use 4 and 51 to control fatigue & produce extreme mental effort?

12. Can we guarantee total amnesia under any and all conditions?

13. Can we "alter" a person's personality? Can this be made permanent? If not could it be done indefinitely for a short period of time?

5

14. Can we design tests to determine whether or not an individual has been "conditioned" by H or SI or any other method? Can H or SI conditioning be detected by use of H and SI? Could any test be developed so that untrained agency personnel could detect H or SI conditioning?

15. Can we place a "conditioned" subject in recall by H and SI specifically show they were conditioned (drugs, tortures, fatigue, hostage pressure etc)?

16. Is there a positive method of breaking a post H suggestion or breaking any SI controlled operation? Is there a method of finding out what post H suggestion or SI controlled operation the hypnotist subject prior to its being put into effect. Can post H suggestions be changed or converted to another use by others using the same techniques?
