22 January 1952

Case

1. The report on Case , dated 8 January 1952, delivered to me by several days ago, is one of the most helpful and constructive we have received in a long time. indicated to me that he was following up on the lead in paragraph 6 with .

2. In the meantime we wonder if you could obtain more information from at the Medical School on his use of nicotinomid with privine for the treatment of schizophrenic patients. Specific information we would like to obtain is:

a. A spectophotometric curve of the nicotinomid privine combination.

b. Exact information on the experiments conducted including dosage, results achieved, undesirable side effects, if any, condition of the patient after the shock reaction and whether or not he had amnesia with respect to the shock. (An easy way of drawing out the information wanted is to ask him to compare this shock reaction with that achieved with items such as insulin, electric shock, etc. Actual case histories, of course, would give us the best information, but he may not wish to release these.)

3. Thank you again for the excellent work you did in this case and we will appreciate anything you can do with regard to this additional requirement.
