[redacted]

A/B, III, 6, 1

7 January 1953

OUTLINE OF SPECIAL H CASES

A In a general request for volunteers [redacted] volunteered for H experimentation and were originally tested on 21 May 1951. Both girls were, at this time, nineteen years of age.

A On 9 January 1952, in a group of volunteers, [redacted] was initially tested in the H techniques along with a group of volunteers.

A [redacted] at this time, was twenty years of age.

In each instance, all volunteers on the initial contact were given a brief discussion of H, were given a very general picture of Security's interest in the work and were given a very pointed lecture on the necessary security essential to these operations.

In each instance, after the above explanations had been made, all subjects were tested in the following manner:

A. Falling back test

B. Hand and arm levitation test

C. General relaxation procedure with explanation.

A It should be noted that [redacted] on their initial tests, responded successfully to the falling back and levitation tests but on the relaxation or sleep induction tests were not overly successful. However,

[redacted]

[redacted]

since both girls were intelligent and co-operative they were, at that point, regarded as very good material. The same more or less applied to [redacted] who did not appear particularly suggestable to the above mentioned tests, but since she had shown interest she was regarded at this point as being a good future subject. For matter or record, in all three cases on the second effort at induction each subject succeeded in obtaining a very deep H state and thereafter and up to the present time, these girls have been exceptionally splendid subjects.

All of these individuals have been given numerous tests from simple post H to very complex activities and have performed in what we believe to be a highly indicative manner.

The writer and [redacted] have never felt that we could determine by experimentation what actually could be done with the H technique under field operating conditions with life and death element at stake. However, the writer and [redacted] do firmly believe that from a physical point of view, a great deal can be determined what individuals can do under H.

All of these subjects have clearly shown that hallucinations, illusions, and amnesias can be promoted through H. They have done very complicated mechanical acts such as learning to use a camera, open safes, typewrite, set timing mechanisms, fire guns, etc. under H.

[redacted]

[redacted]

In addition, under H they have moved all over the building, passed guards, engaged in conversation, taken polygraph tests, written, drawn fully under H and have had total amnesia for the H activities. Furthermore, in these cases, when work has been executed for a considerable period of time, H commands have been carried on in matters of a few seconds although H was not discussed or in any way brought to the attentionof the subjects for periods existing over months at a time.

Recently, in view of the broadened approach to the problem and also in view of the fact that we have lost the services of [redacted] we carried out experiments involving considerable areas in and around Washington. These experiments clearly demonstrated to a certain extent that individuals under H can move about, travel and act normal over a certain amount of time and space and may possibly have a bearing on more advanced experimentation which this Office wishes to undertake in the future. In this connection, this Office expects a report from [redacted] our professional H consultant from [redacted] in the near future. This report should cover [redacted] checks on certain very pertinent matters concerning very advanced uses of H. The report should have been in several weeks ago but owing to certain personal matters, [redacted] has not been able to complete it. This report will be available for all interested parties upon completion.

Since these subjects have been actively engaged in this work for some time, they have, as mentioned above, taken part in a great many

[redacted]

[redacted]

difficult tests and experiments but basically the efforts of the writer and [redacted] were turned toward producing a normal type of activity while under H and also how could H be obtained on an individual via the telephone or very subtle methods without the person's immediate associates realizing that H control had been obtained. In all of these cases, these subjects have clearly demonstrated that they can pass from a fully awake state to a deep H controlled state via the telephone, via some very subtle signal that cannot be detected by other persons in the room and without the other individual being able to note the change. It has been shown clearly that physically individuals can be induced into H by telephone, by receiving written matter or by the use of code, signals, or words/that and control of those hypnotized can be passed from one individual to another without great difficulty. It has also been shown by experimentation with these girls that they can act as unwilling couriers for information purposes and that they can be conditioned to a point where they can believe a change in identy on their part even on the polygraph. Whether or not H could be used as a challenge to the polygraph cannot be stated by the writer and [redacted] since we are lacking statistical information, but, in certain instances, it has been clearly shown that H can materially affect polygraph readings. Further experimentation along these lines is contemplated.

All of the above will show that certain normal individuals are capable of very deep H and can carry out activities which may be of value from the ARTICHOKE point of view.

[redacted]

[redacted]

Our tests, which now number in the thousands with dozens of subjects, while strongly indicative, are not, in our opinion, complex enough or carried out under hazardous conditions to warrant extravagant claims for operational use. They do, however, indicate that it has a potentiality as a weapon either as an information gaining asset or as an operational weapon.
