Subj: SI and H experimentation, 3 March 1954.

On 3 March 1954, SI and H experimentation and research was carried on in Room 20, Building 13, by Messrs. [redacted] and [redacted] using the following subjects: Misses [redacted] and [redacted].

Routine tests and inductions and straight PH were tried throughout the evening's work. One special slow induction was given to assist Mi[redacted] who apparently is slow in accepting H control.

A

The only unusual activity insofar as the work of the evening was concerned was that Miss[redacted] and M[redacted] were instructed to remain in a very deep slwmp state and Miss[redacted] while in a sleep state with her eyes open was instructed to try to awaken the two sleepers. Miss[redacted] tried by shaking and calling the names of both girls loudly without results and then apparently in exasperation dragged Miss[redacted] out of the chair and let her fall to the floor in an effort to awaken her. This effort was unsuccessful. This seemed unusual in view of the fact Miss[redacted] is very unemotional and while a good subject has not been aggressive in any of her work. For matter of record, Miss[redacted] had not amnesia of the activity and clearly remembered pulling M[redacted] from the chair. Also for matter of record, it should be noted that M[redacted] who was sleeping on the floor was partially fallen on by [redacted] when she was dragged out of the Chair but Miss[redacted] remained asleep during the entire activity. The session closed at about 8:30.
