Subject: SI and H experimentation, 24 February 1954.

On 24 February 1954, SI and H experimentation took place in Room 20, Building 13. Messrs. [redacted] and [redacted] used the following subjects: Misses, [redacted] and [redacted].

In view of the large number of volunteers present and in view of the fact Misses [redacted] and [redacted] had not worked for several months, the work was reverted to several slow, standard inductions to assure us that all persons present except Miss [redacted] were capable of obtaining more or less the same level. Results were entirely satisfactory and routine PH were given at each induction. The first two induction were held and averaged about 30 minutes each. The third induction, which was again run out of PH was of interest in that all volunteers were instructed to open their eyes and act completely normal during the major portion of this trance. In this connection, all hands carried out instructions including movement, smoking, drinking cokes, conversation, etc. and were returned to sleep states by a simple touch on the forehead by Mr [redacted]. For record purposes, Miss [redacted] showed some improvement but is not yet up to the capacity of the other volunteers.

The fourth induction out of a Ph was run in which all PH instructions were removed and following this all subjects were questioned as to the amount of amnesia they had in connection with the thrid induction when they operated with their eyes open and moved about, etc. As usual, Miss [redacted] had a total amnesia for the performance. Some reported a slight memory of activities and some reported they could remember all the activities. The session was concluded at approximately 8:30.
